

Problem: *Mycosphaerella* Leaf Spot (*Mycosphaerella effigurata* (Schwein.) House, *Mycosphaerella fraxinicola* (Schwein.) House)

Hosts: Ash, walnut

Description: This is a late summer fungus disease we do not often see in Kansas unless we have a wet summer. *Mycosphaerella* initially causes small yellow spots or irregular green blotches. In severe cases, infected areas can coalesce and may appear scorched.

Recommendations: Defoliation occurs late enough in the year that plant health is rarely affected. No control measures are recommended.
