Problem: Pine Needle Scale - *Chionaspis pinifoliae*

**Hosts:** Pine, spruce, fir, hemlock, and, occasionally, yew and cedar.

**Description:** Pine needle scale is an armored scale that is found across the United States but especially in the eastern half. Pine needle scale appears as conspicuous white specks on the needles. Scales feed by sucking sap from needles causing them to yellow and eventually brown. Heavy infestations can kill twigs, branches and even entire trees. Though both female and males are white, the female is larger (1/8 inch long) and wider at one end with the narrow end sporting a yellow or orange cap. Males are 1/32 inch long and narrow. Crawlers are bright red to brown.

Pine needle scale overwinters as eggs underneath female covers. Each female produces about 100 eggs. There are two generations per year in Kansas with crawlers appearing in May to early June and again in mid- to late July. The first generation coincides with full bloom of Vanhoutte Spirea and the second generation when the blooms of *Hydrangea arborescens* ‘Grandiflora’ turn from white to green.

**Recommendations:** Dormant oil treatments can be applied in early spring to kill overwintering eggs in March, or insecticides can be applied to exposed first- or second-generation crawlers.

First-generation scale hatches about the same time that Vanhoutte spirea blooms. Vanhoutte spirea is the white-flowered spirea with arching branches that most often blooms in the latter half of April. Though crawlers are a bright red to brown color, they are so small that a magnifying glass should be used to check for them. Once the scale has settled down and formed its waxy cover, insecticides are ineffective. Remember, insecticides must be applied to crawlers soon after they emerge. Check for
crawler activity at seven-day intervals for the two weeks following your initial spray. If active crawlers are present, spray again.

Second generation crawlers appear when *Hydrangea arborescens* ‘Grandiflora’ blossoms are turning from white to green. This is usually in mid- to late-July. You may want to use double-sided Scotch tape and loop it around several needles to make sure crawlers are out. Some people prefer to use electrical tape coated with vaseline. Use a color that contrasts with the color of the crawlers. The crawlers will be caught when they try to crawl across the tape and may be easier to see.

Effective insecticides include acephate (Orthene, Bonide Systemic Insect Control), cyfluthrin (Tempo, BioAdvanced Vegetable & Garden Insect Spray) and permethrin, (Hi-Yield 38 Plus; Hi-Yield Garden & Farm Insect Control; Bonide Eight Vegetable, Fruit & Flower Concentrate).
